Optimised IgE-CH3 domain antigen peptide for dog IgE. AAY79999 standard; Peptide; 25 AA. 15-MAY-2000 (first entry) AAY79999; RESULT AAY79999

Immunoglobulin E; IgE; epsilon heavy chain; antigenic; antigen; immunogenic; immunostimulatory; carrier protein; helper T cell epitope; antibody; allergy; allergic disease; immunisation; anti-allergic; anti-anti-arathmatic; asthma; anaphylaxis; dermatitis.

99WO-US13959 98US-0100287 21-JUN-1999; 20-JUN-1998; W09967293-A1 29-DEC-1999. Canis sp. Synthetic.

(UNBI-) UNITED BIOMEDICAL INC. Wang CY, Walfield AM; WPI; 2000-160578/14. New antigenic peptide from the CH3 domain of immunoglobulin E, fusions for immunization against allergy $\,$

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY79994 to AAX80084 represent amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

(I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous I helper cell epitope
and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. ARY79994 to AAR90084 represent amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Immunoglobulin E; IgE; epsilon heavy chain; antigenic; antigen; immunogenic; immunostimulatory; carrier protein; helper T cell epitope; antibody; allergy; allergic disease; immunisation; anti-allergic; anti-ashmatic; asthma; anaphylactic; anti-ashmatic; asthma; anaphylaxis; dermatitis.

antigenic peptides (1). (1) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (1) induces polyclonal antibodies specific for a target effector site on the peptiden heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (1) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (1) that include a promiscuous Thelper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. NAY79994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  antigenic peptides (1). (1) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (1) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and
                                                                                                                                                                                                                                                                                                                                           immunogenic; immunostimulatory; carrier protein; helper T cell epitope; antibody; allergy; allergic disease; immunisation; anti-allergic; anti-anaphylactic; anti-asthmatic; asthma; anaphylaxis; dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antigenic peptide from the CH3 domain of immunoglobulin E, fusions

antigence peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of 1gE, and so preventing triggering and activation of mast cells and basophils and so preventing triggering and activation of mast cells and basophils and downregulation of 1gE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against 1gE-mediated allergies, e.g. food allergies, action in anaphylaxis, or float-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies, AAY79994 to AAX80084 represent amino

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antigenic peptides (1). (1) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (1) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of 1gE, and so preventing triggering and activation of mast cells and basophils and downregulation of 1gE synthesis. Conjugates, or fusion peptides, containing (1) are used for active immunisation against 1gE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (1) that include a promiscuous Thelper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY79994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                           This is a partial canine immunoglobulin E (IgE) protein. Peptide fragments (AAW24098-106) containing at least five continuous amino acids of this sequence are used for the preparation of anti-canine IgE antibody. The anti-canine IgE antibody can be used for the diagnosis of canine allergies.

antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY79994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunogenic peptide consisting of opossum CH2, dog CH3 and opossum CH4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is an immunogenic peptide consisting of the heavy chain constant regions 2 and 4 of the opossum IgE and the heavy chain constant region 3 from the dog. It was shown to cause a stronger
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Dog; opossum; immunoglobulin E; IgE; vaccination; infection; allergy; asthma; eczema; immunogenic peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Immunogenic polypeptides useful for preventing the harmful effects of immunoglobulin E in mammals -

This polypeptide is encoded by exons 1-4 (see AAT79278) of canine IgE heavy chain constant region (epsilon) genomic DNA. Another polypeptide, comprising the exon 5 and 6 product, is given in AAW23068. Recombinant peptides encoded by exons 1-6 can be produced in eukaryotic or prokaryotic cells. Such peptides, and antibodies raised against them, are used in methods to treat the manifestation of allergy in dogs, e.g. to treatment Type I immediate hypersensitivity, and for immunomodulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   IgE; immunoglobulin; antibody; vaccine; allergy; hypersensitivity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The canine IgE amino acid sequence (AAR97753) was deduced from an isolated gene (AAT29824) obtd. from a canine liver DNA library. The cloning of the IgE gene allows prodn. of large quantities of recombinant IgE using bacterial, yeast, mammalian, insect or viral systems. The IgE can be used in drug development (e.g. small molecule screening, assay development and anti-IgE antibody generation). Fragments of IgE can be used in vaccines or to prevent IgE-mediated hypersensitivity. The new sequence information permits targeted modulation of IgE-mediated immune
                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and soo preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous Thelper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY79994 to AAY80084 represent amino conformation.

The invention relates to novel promiscuous T helper cell epitopes (Th),
and immunogenic peptides comprising the Th epitopes of the invention
along with B cell epitopes. The Th epitopes and peptide immunogens
containing them, are used to induce a T helper cell response,
specifically against Plasmodium falciparum, cholesteryl ester transport
containing them, are used to induce a T helper cell response,
specifically against Plasmodium falciparum, cholesteryl ester transport
containing them, are used for prevention and/or treatment of
immunocens may be used for prevention and/or treatment of
infections (HINY, foot-and-mouth disease or malarals); for cancer
containing hormone (LHRH) for contraception, treatment of hormone
containing hormone (LHRH) for contraception, treatment of hormone
contraction); for promoting the growth of animals; or for
immunocastration); for promoting the growth of animals; or for
treating allergies or arteriosclerosis. Incorporation of a promiscuous
contraction in genetically diverse subjects) into an immunogen
contraction in production of antibodies against a target
consect resulting in production of antibodies against a target
consect resulting in production of antibodies against a target
consect resulting in production of antibodies against a target
consect resulting in production of antibodies against a target
consect resulting in production of antibodies against a target
constitute an replace carrier proteins and seduences Aay91122-191144.

Aay9125 and AAy91245-19144 represents a promiscuous Th epitope
from the measles virus F (MVF) protein and sequences
comprising an LHRH sequence AAy91143 represents a promiscuous Th epitope
comprising an LHRH sequence Johned to a promiscuous Th epitope.
AAY91156-Y91164 AAY91227 and AAY91241-404 are antigenic
comprising an LHRH target antigenic peptide used in these LHRH target antigenic peptides comprising somatostatin, and a Th epitope. Sequence peptides comprising somatostatin, and a Th epitope.
Comprising the LHRH requer antigenic and the promiscu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New artificial T helper cell epitope and derived immunogens with target antigenic site, for immunization against e.g. malaria, arteriosclerosis or human immune deficiency virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Example 6; Page 40; 129pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (UNBI-) UNITED BIOMEDICAL INC
                                                                                                                                                                                                                                                                                                                                                                                                                                                       98US-0100412.

chilerope/CD4 CDR2 antigenia peptides which may be used to prevent HIV
chilerope/CD4 CDR2 antigenia peptides which may be used to prevent HIV
cells. AAY90212 is a modified version of a human IgE
(immunoglobulin B) CH3 domain, and AAY90213-Y90219 are Thepitope/TgE CH3
antigenic peptides which may be used in the treatment of alleropes/TgE CH3
AAY91220 is a peptide derived from foot and mouth disease virus (FMDV)
vPl capsid protein and AAY91221-Y91222 comprise this peptide and a Th
ceptiope and may be used in a malaria vaccine. AAY91228-Y91231 represent
CETP peptide and aTh epitope which may be used to prevent or treat
cETP peptide and aTh epitope which may be used to prevent or treat
arterioscierosis and cardiovascular disease. AAY9124-Y91251 and AAY91257
arterioscierosis and cardiovascular disease. AAY9124-Y91251 and AAY91257
arterioscierosis and cardiovascular disease. AAY9124-Y91251 and AAY91257
arterioscierosis and cardiovascular disease. AAY9124-Y91251 and AAY91256-Y91273 are antigenic peptides comprising WNH Th and HIV-1 B-cell
comprise which may be used as a component in an anti-HIV-1 vaccine.
AAY91198 and AAY91199 are respectively an immunostimulatory invasin
c protein epitope from Yersinia species, and hinge spacer peptide, both of
which may optionally be used in the antigenic peptides of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
human CD4 CDR2-like domain antigenic site, and AAY91209-Y90211 are MVH Th

              induction of a specific immune response to LiRH which is involved in regulation of spermatogenesis, ovulation, oestrus, sexual development and secretion of sex hormones. Provision of a promiscuous T helper epitope (which is functional in genetically diverse subjects) provides optimum immunogenicity to the B cell epitopes of the target antigen and thus high antibody titres against the target antigen. The peptide immunogens of the invention are used to vaccinate against mammalian LHRH, for use as (reversible) contraceptive; control of hormone-dependent boar taint (and improve meat quality) and for immunocastration. The present sequence appears in the specification.
                                                                                                                                                                                                                                                                                                                                                                 Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A; Title: The nucleotide sequence of the mouse immunoglobulin epsilon gene: comparison A; Reference number: A90966; MuID: 84236092
A; Accession: A02145
A; Accession: A02145
A; Moccule type: DNA
A; Residues: 1-423 < ISH>
A; Note: the sequence was determined from the germline gene
C; Genetics:
A; Introns: 91/1; 199/1; 307/1
C; Complex: An immunoglobulin heterotetramer subunit consists of two identical light (hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into C; Superfamily: immunoglobulin C region; immunoglobulin homology < IMM2>
F; 16-77/Domain: immunoglobulin homology < IMM2>
F; 16-77/Domain: immunoglobulin homology < IMM3>
F; 250-288 / Domain: immunoglobulin homology < IMM4>
F; 23-75/Domain: immunoglobulin homology < IMM4 </p>
F; 23-75/Domain: immunog

C;Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kap hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into la C;Complex: An immunoglobulin C region; immunoglobulin homology (seywords: duplication; glycoprotein; heterotetramer; immunoglobulin homology (fragment) <IMI> F:1-44/Domain: immunoglobulin homology (ims) F:186-254/Domain: immunoglobulin homology <IMI> F:186-254/Domain: immunoglobulin homology <IMI> F:290-361/Domain: immunoglobulin homology <IMI> F:200-361/Domain: immunoglobulin homology <IMI

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   C;Accession: A02144

T28149
MMC class I histocompatibility antigen B-F alpha chain 2 - chicken
C;Species: Gallus gallus (chicken)
C;Date: 15-Oct-1999 #sequence_revision 15-Oct-1999 #text_change 20-Jun-2000
C;Accession: T28149
R;Milne, S: Kaufman, J: Beck, S.
submitted to the EMBL Data Library, May 1998
A;Description: DNA sequencing and analysis of the chicken major histocompatibility compl
A;Reference number: 220475
A;Accession: T28149
A;Accession: T28149

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
antigento peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of Ige, and so preventing triggering and activation of mast cells and basophils and so preventing triggering and activation of mast cells and basophils and downregulation of Ige synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscences Thelper cell epitope (Inottional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY79994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Promiscuous T-cell epitope; measles virus F protein; MVF; hepatitis B virus surface antigon; HBV; immunogenic; B-cell epitope; lutelnising hormone releasing hormone; LHRH; contraceptive; anticancer; somatostatin; growth promotion; CD4 receptor; HIV-1; antiviral; FMDV; foot and mouth disease virus; immunoglobulin E; IGE; anti-allergic; Plasmodium falciparum; circumsporozoite; antimalarial; CETP; cholestery! ester transport protein; anti-arteriosoleotic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New artificial T helper cell epitope and derived immunogens with target antigenic site, for immunization against e.g. malaria, arteriosclerosis or human immune deficiency virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                         present invention describes immunoglobulin E (IgE)-CH3 domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

The invention relates to novel promiseuous T helper cell epitopes (Th), and mannogenic peptides comprising the The pitopes of the invention and mannogenic peptides comprising the The pitopes and peptide immunogens continuing them, are used to induce a T helper cell response, specifically against Plasmodium falciparum, cholesteryl ester transport protein (CETP) or HIV epitopes, but more generally against any pathogen, immunoceactive self-antigen or tumour antigen. The Th epitopes and peptide immunogens may be used for prevention and/or treatment of infections (HIV, foot-and-mouth disease or malaria); for cancer immunoceacture self-antigen or tumour antigen. The Th epitopes and peptide immunoceacture protein of peptides or article proteins and publicated immune ceptides or article proteins and publicated immune ceptides or resulting in production of antihodies against a target antigen. Th (tunctional in genetically diverse subjects) into an immunogen peptides. The personnes resulting in production of antihodies against a target antigen. The personnes resulting in production of antihodies against a target of personne proper personne proteins and sequence and proper personnes resulting in production of antihodies against a target of peptides. The personnes antigen peptides and proper peptides and proper personnes are promiseuous of the personne sequence ANY91141 represents a promiseuous T helper peptides. ANY91201 sometostatin and any sequence antigen. ANY91201 represents a promiseuous may be used to promote growth in livestock. ANY91208 is a human Ode CDR2 antiganic peptides which may be used to prevent or treat carteriosic and may be used to promote growth in livestock. ANY91201 represent corpused and may be used to promote growth in an maintie of any personne corpus and may be u

                                                                                                                                                                                                                                                                                                                                                                                                                synthetic helper T cell (Th) epitope and a target antigen, luteinising hormone-releasing hormone (LHRH). The peptide immunogens cause induction of a specific immune response to LHRH which is involved in regulation of spermatogenesis, covulation, oestrus, sexual development and secretion of sex hormones. Provision of a promiscuous T helper apitope (which is functional in genetically diverse subjects) provides optimum immunogenicity to the B cell epitopes of the target antigen and thus high antibody titres against the target antigen. The peptide immunogens of the invention are used to vaccinate against mammalian LHRH, for use as (reversible) contraceptive; control of hormone-dependent
                          luteinising hormone-releasing hormone; spermatogenesis; ovulation; osstrus; sexual development; sex hormone; promiscuous T helper epitope; vaccine; contraceptive; hormone-dependent tumour; prostate cancer; breast cancer; endometriosis; boar taint; meat quality; immunocastration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Immunoglobulin E; IgE; epsilon heavy chain; antigenic; antigen; immunoglobenic; immunostimulatory; carrier protein; helper T cell epitope; antibody; allergy; allergy; disease; immunisation; anti-allergic; anti-anaphylactic; anti-asthmatic; asthma; anaphylaxis; dermatitis.
                                                                                                                                                                                                                                                                                                                   New peptide immunogen containing luteinising hormone-releasing hormone antigen site and helper T cell epitope, for e.g. contraception and treatment of cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           tumours (cancer of prostate or breast, also endometriosis); to prevent boar taint (and improve meat quality) and for immunocastration. The present sequence appears in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of 1gE, and so preventing triggering and activation of mast cells and basophils and downregulation of 1gE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against 1gE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermattis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AA77994 to AA80084 represent amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     hepatitis B virus surface antigen; HBV; immunogenic; B-cell epitope; luteinising hormone releasing hormone; LHRH; contraceptive; anticancer; somatcostatin; growth promotion; CD4 receptor; HIV-1; antiviral; FMDV; foot and mouth disease virus; immunoglobulin E; IgE; anti-allergic; Plasmodium falciparum; circumsporozoite; antimalarial; CETP; cholesteryl ester transport protein; anti-arteriosclerotic.
New antigenic peptide from the CH3 domain of immunoglobulin E, fusions for immunization against allergy \,\text{-}\,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

New artificial T helper cell epitope and derived immunogens with target antigenic site, for immunization against e.g. malaria, arteriosclerosis or human immune deficiency virus

Example 6; Page 99; 129pp; English.

The invention relates to novel promiscuous T helper cell epitopes (Th), and immunogenic peptides comprising the Th epitopes of the invention along with B cell epitopes. The Th epitopes and peptide immunogens containing them, are used to induce a T helper cell response, specifically against Plasmodium falciparum, cholesteryl ester transport protein (CETP) or HIV epitopes, but more generally against any pathogen, immunoreactive self-antigen or tumour antigen. The Thepitopes and peptide immunogens may be used for prevention and/or treatment of infections (HIV, foot-and-mouth disease or malaria); for cancer immunotherapy; for inhibition of the action of luteinising hormone (LHRH) for contraception, treatment of hormone-dependent cancer, prevention of boar taint in meat, and immunocastration); for promoting the growth of animals; or for treatment of hormone immunocastration); for promoting the growth of animals; or for treating allergies or arteriosclerosis. Incorporation of a promiscuous in proves capacity to induce a strong T helper cell-mediated immune improves capacity to induce a strong T helper cell-mediated immune improves capacity to induce a strong T helper cell-mediated immune improves capacity to induce a strong T helper cell-mediated immune improves capacity to induce a strong T helper cell-mediated immune improves capacity to induce a strong T helper cell-mediated immune improves capacity to induce a strong T helper cell-mediated immune improves capacity to induce a strong T helper cell-mediated immune improves capacity to induce a strong T helper cell-mediated immune improves capacity to induce of antibodies against a target capacity to induce of antibodies against a target capacity capacity to induce a strong T helper cell-mediated immune improves the capacity to induce a strong T helper cell-mediated immune improves the capacity to induce a strong T helper cell-mediated immune improves the capacity to induce a strong T helper cell-mediated immune improves capacity to induce of antibodies against a ta antigen. The tan replace carrier proteins and pathogen-derived T helper epitopes. Sequence AAY91121 represents a promiscuous T helper epitope from the measles virus F (MVF) protein and sequences AAY91122-Y91142.

AAY91226 and AAY91246 represent synthetic Th epitopes based on the MVF Th epitope. Sequence AAY91143 represents a promiscuous Th epitope MAY91144-Y91155 are synthetic epitopes derived from this HBV epitope.

AAY91144-Y91155 are synthetic epitopes derived from this HBV epitope. AAY91156-Y91196, AAY91227 and AAY91242-Y91244 are antigenic peptides

antigenic site, for immunization against e.g. malaria, arteriosclerosis or human immune deficiency virus New artificial T helper cell epitope and derived immunogens with target

Example 6; Page 99; 129pp; English.

The invention relates to novel promiscuous T helper cell epitopes (Th), and immunogenic peptides comprising the Th epitopes of the invention along with B cell epitopes. The Th epitopes and peptide immunogens

```
comprising an LHRH sequence joined to a promiscuous Th epitope. AAY91197

1s the LHRH target antigenic peptide used in these LHRH antigenic

peptides. AAY91200 is somatostatin, and AAY91201-Y91207 are antigenic

peptides comprising somatostatin and a Th epitope. Somatostatin

Immunogens may be used to promote growth in livestock. AAY91208 is a

human CD4 CDR2-like domain antigenic site, and AAY91209-Y99211 are MVH Th

epitope/CD4 CDR2 antigenic peptides which may be used to prevent HIV

infection of T cells. AAY90212 is a modified version of a human IgE

ontigenic peptides which may be used in the treatment of allergies.

AAY91220 is a peptide derived from foot and mouth disease virus (FMBV)

VPI capsid protein and AAY91221-Y91222 comprise this peptide and a Th

epitope. AAY91221 is a Plasmodium falciparum circumsporozoite (CS) target

antigen, and AAY91224-Y91255 comprise the CS antigen and an WNF Th

cepitope and may be used in a malaria vaccine. AAY91289-Y91231 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                    CETP-derived peptides and AAY91232-Y91241 are immunogens comprising a crep-derived peptides and AAY91241 are immunogens comprising a retriosclerosis and cardiovascular disease. AAAy9124 and AAY91252-Y91257 are HIV-1 neutralising B-cell epitopes, and AAY91248-Y91251 and AAY91258-Y91273 are antigenic peptides comprising WVH Th and HIV-1 B-cell epitope which may be used as a component in an anti-HIV-1 vaccine. AAX91198 and AAX91199 are respectively an immunostimulatory invasin protein epitope from Yersinia species, and hinge spacer peptide, both of which may optionally be used in the antigenic peptides of the

AAY91217 standard; peptide; 42 AA. (first entry) 22-MAY-2000 AAY91217;

Modified MVF Th epitope/IgE CH3 domain, SEQ ID NO:97.

Promiscuous T-cell epitope; measles virus F protein; MVF; hepatitis B virus surface antigon; HBV; immunogenic; B-cell epitope; luteinising hormone releasing hormone; LHRH; contraceptive; anticancer; somatostatin; growth promotion; CD4 receptor; HIV-1; antiviral; FMDV; foot and mouth disease virus; immunoglobulin B; IgE; anti-allergic; eholesteryl ester transport protein; anti-altergic; cholesteryl ester transport protein; anti-arteriosclerotic.

Chimeric - Measles virus. Chimeric - Homo sapiens.

containing them, are used to Induces a Thelper cell response, specifically against Plasmodium falciparum, cholesteryle ster transport proficioning them, are used to Induce a Thelper cell response, specifically against Plasmodium falciparum, cholesteryle ster transport protein (CETP) or HIV epitopes, but more generally against any pathogen, immunoreactive self-antigen or tumour antigen. The The pitopes and peptide immunogens may be used for prevention of the action of Intenising hormone content infections (HIV, foot-and-mouth disease or malaria); for cancer immunoreactive self-antigen or the action of Intenising hormone celeasing hormone (HRH) foot-and-mouth disease or malaria); for cancer immunosertation); for promoting the growth of animals; or for treating allergies or arteriosclerosis. Incorporation of a promiscuous celeasing allergies or arteriosclerosis. Incorporation of a promiscuous of furcating allergies or arteriosclerosis. Incorporation of a promiscuous improves capacity to induce a strong Thelper cell-mediated immune response, resulting in production of antibodies against a target antigen. The nor replace carrier proteins and pathogen derived Thelper ceptiopes. Sequence AAY91141 represents a promiscuous Thelper from the measales vivus [HWY) surface antigen; and sequences. Sequence AAY91145 represents a promiscuous Theptope. AAY91155 and SAY91154. Tepresents a promiscuous The epitope. AAY91197 or pathogen. Sequence AAY91141 represents a promiscuous The epitope. AAY91197 or pathogen. Sequence AAY91144 replace of comprising an LHH sequence of order of a promiscuous The epitope. AAY91197 or peptides. AAY91105, AAY9127 and AAY91245 replace of the peptides comprise in a malacet comprise the comprise of promite growth in livestock. AAY91209 reptides which may be used to promise the centum of a cells. AAY90212 reptides which may be used in the treatment of a limentogen may be used to promise the C immunoglobulin By CH3 domain and the present of cells. AAY90122 reptides which may be used to prevent HIV ceptio arteriosclerosis and cardiovascular disease. AAY91247 and AAY91252-Y91257 are HIV-1 neutralising B-cell epitopes, and AAY91248-Y91251 and AAY91258-Y91273 are antigenic peptides comprising MVH Th and HIV-1 B-cell epitope which may be used as a component in an anti-HIV-1 vaccine. Axy1108 and AxY91199 are respectively an immunostimulatory invasin protein epitope from Yersinia species, and hinge spacer peptide, both of which may optionally be used in the antigenic peptides of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Wang CY;
NAMES OF THE PROPERTY OF THE P
```

```
The present invention describes immunoglobulin E (IgE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disnified bridge) to stabilise conformational in genetics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY79994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                Immunoglobulin E; IgE; epsilon heavy chain; antigenic; antigen; immunoglobulinitatory; carrier protein; helper T cell epitope; antibody; allergic disease; immunisation; anti-allergic; anti-asthmatic; asthma; anaphylactic; anti-asthmatic; asthma; anaphylaxis; dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antigenic peptide from the CH3 domain of immunoglobulin E, fusions for immunization against allergy {\,}^{\circ}
                                                                                                                                                                                                                                                                                                                                                                        IgE-CH3 domain antigen peptide antigenic site 15b SEQ ID NO:14.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The specification describes peptide immunogens comprising a synthetic helper T cell (Th) epitope and a target antigen, luteinising hormone-releasing hormone (LHRH). The peptide immunogens cause induction of a specific immune response to LHRH which is involved in regulation of spermatogenesis, ovulation, oestrus, sexual development and secretion of sex hormones. Provision of a promiscuous T helper epitope (which is functional in genetically diverse subjects) provides optimum immunogenicity to the B cell epitopes of the target antigen and immunogens of the invention are used to vaccinate against mammaliae for use as (reversible) contraceptive; control of hormone-dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New peptide immunogen containing luteinising hormone-releasing hormone antigen site and helper {\tt T} cell epitope, for e.g. contraception and treatment of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       tumours (cancer of prostate or breast, also endometriosis); to prevent boar taint (and improve meat quality) and for immunocastration. The present sequence appears in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DB 21; Length 42;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      100.0%; Score 140;

c pitope/CD4 CDR2 antigenic peptides which may be used to prevent HIV
c infection of T cells. AAY90212 is a modified version of a human IgE
(immunoglobulin B) CH3 domain, and AAY90213-Y90219 are Thepitope/IgE CH3
antigenic peptides which may be used in the treatment of allergies.
AAY91220 is a peptide derived from foot and mouth disease virus (FMDV)
vPl capsid protein and AAY91221-Y91222 comprise this peptide and a Th
c epitope. AAY91223 is a Plasmodium falciparum circumsporozoite (CS) target
antigen, and AAY91224-Y91225 comprise the CS antigen and an MVF Th
c epitope and may be used in a malaria vaccine. AAY91224-Y91231 represent
CCTP-derived peptides and AAY9123-Y91241 are immunogens comprising a
CETP peptide and a Th epitope which may be used to prevent or treat
arterioscierosis and cardiovascular disease. AAY9124-Y91251 and AAY91257
are HIV-1 neutralising B-cell epitopes, and AAY91248-Y91251 and AAY91256
AAY91258-Y91273 are antigenic peptides comprising MVH Th and HIV-1 B-cell
CC Epitope which may be used as a component in an anti-HIV-1 vaccine.
AAY91198 and AAY91199 are respectively an immunostimulatory invasin
C protein epitope from Yersinia species, and hinge spacer peptide, both of
c protein epitope from Yersinia species, and hinge spacer peptide, both of
c protein may optionally be used in the antigenic peptides of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Helper T cell epitope; peptide immunogen; LHRH;
luteinising hormone-releasing hormone; spermatogenesis; ovulation;

AAY9124-Y91195 are synthetic epitopes derived from this HBV epitope. AAY91257 and AAY91242-Y91244 are antigenic peptides comprising an LHRH sequence joined to a promiscuous Th epitope. AAY91197 is the LHRH target antigenic peptide used in these LHRH antigenic peptides. AAY91200 is somatostatin, and AAY91201-Y91207 are antigenic peptides comprising somatostatin and a Th epitope. Somatostatin a the MAY Epitope. Somatostatin and a Th epitope.

                 regulation of spermatogenesis, ovulation, oestrus, sexual development and secrettion of sex hormones. Provision of a promiscousor Thelper epitope (which is functional in genetically diverse subjects) provides optimum immunogenicity to the B cell epitopes of the target antigen and immunogens of the invention are used to vaccinate against the peptide. The peptide immunogens of the invention are used to vaccinate against mammalian LHRH, for use as (reversible) contraceptive; control of hormone-dependent tumours (cancer of prostate or breast, also endometriosis); to prevent boar taint (and improve meat quality) and for immunocastration. The present sequence appears in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antigenic peptides (I). (I) have anti-allegic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (Anctional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Immunoglobulin E; IgE; epsilon heavy chain; antigenic; antigen; immunoglobelic; immunostimulatory; carrier protein; helper T cell epitope; antibody; allergy; allergy disease; immunisation; anti-allergic; anti-asthmatic; asthma; anaphylactic; anti-asthmatic; asthma; anaphylactic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antigenic peptide from the CH3 domain of immunoglobulin E, fusions for immunization against allergy \boldsymbol{\cdot}

The invention relates to novel promiscuous T helper cell epitopes (Th),
and immunogenic peptides comprising the Th epitopes of the invention
along with B cell epitopes. The Th epitopes and peptide immunogens
containing them, are used to induce a T helper cell response,
specifically against Plasmodium falciparum, cholesteryl ester transport
protein (EEFP) or HIV epitopes, but more generally against any pathogen,
immunoreactive self-antigen or tumour antigen. The Th epitopes and
peptide immunogens may be used for prevention and/or treatment of
infections (HIV, foot-and-mouth disease or malaria); for cancer
infections (HIV) foot-and-mouth disease or malaria); for cancer
cleasing hormone (LHRH) for contraception, treatment of hormone
cleasing hormone (LHRH) for contraception, treatment of hormone
dependent cancer, prevention of boar taint in meat, and
immunocastration); for promoting the growth of animals; or for
treating allergies or arteriosclerosis. Incorporation of a promiscuous
Th (functional in genetically diverse subjects) into an immunogen
                                                                                                                                                                                           ö
                maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY79994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Promiscuous T-cell epitope; measles virus F protein; MVF; hepatitis B virus surface antigen; HBV; immunogenic; B-cell epitope; luteinising hormone releasing hormone; LHRH; contraceptive; anticancer; somatostatin; growth promotion; CD4 receptor; HIV-1; antiviral; FMDV; foot and mouth disease virus; immunoglobulin E; IgE; anti-allergic; plasmodium falciparum, circumsporozoite; antimalarial; CETP; cholestery! ester transport protein; anti-arteriosclerotic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New artificial T helper cell epitope and derived immunogens with target antigenic site, for immunization against e.g. malaria, arterlosclerosis

cresponse, resulting in production of antibodies against a target antigen. The can replace carrier proteins and pathogen-derived Theiper antigen. The can replace carrier proteins and pathogen-derived Theiper epitopes. Sequence AXY91121 represents a promiscuous Theiper epitope (CC from the measles virus F (MVP) protein and sequences AXY91122-791142, AXY91226 and AXY91245 represents a promiscuous Theiptopes based on the from theipertitis B virus (fibW) surface antigen, and sequences AXY91122-791144.

AXY9126-Y91196, AXY91227 and AXY91242-Y91344 are antigenic peptides comprising an LHRH sequence joined to a promiscuous Th epitope. AXY91197 and AXY91242-Y91344 are antigenic peptides comprising somatostatin, and AXY91201-Y92107 are antigenic peptides comprising somatostatin, and AXY91201-Y92107 are antigenic peptides comprising somatostatin and a Th epitope. Somatostatin compress may be used to promote growth in livestock. AXY91201 are antigenic peptides comprising somatostatin antigenic site, and AXY91201-Y90201 are myll the comprising somatostatin antigenic site, and AXY91201-Y90201 are myll the comprising peptides which may be used to promote growth in livestock. AXY91208 is a modified version of a lumman IQU cope. Comprising which may be used in the treatment of allergies. AXY91201 is a peptide derived from foot and AXY91219 are The epitope. IX of antigenic peptides which may be used in the treatment of allergies. The copitope and may be used in malaria vaccine. AXY91228 roughlish and AXY91221 and AXY91222 roughlish and may be used in an allaria vaccine. AXY91228 roughlish and AXY91221 and AXY91228 roughlish and may be used in an anti-HIV-1 waccine. AXY9128-Y91231 are antigenic peptides and and AXY91222 roughlish and AXY91231 are antigenic peptides comprising WWH Th and HIV-1 heutralishing a cell epitopes, and AXY91228 roughlish and AXY9128-Y9123 are antigenic peptides comprising WHY Th and AXY9129 are antigenic peptides comprisely and AXY9128-Y9123 are antigenic peptides. AXY9128-Y9123 are antigenic peptides wh

(first entry) 22-MAY-2000

Modified MVF Th epitope/IgE CH3 domain, SEQ ID NO:94.

Promiscuous T-cell epitope; measles virus F protein; MVF; hepatitis B virus surface antigen; HBV; immunogenic; B-cell epitope; luteinising hormone releasing hormone; LHRH; contraceptive; anticancer; somatostatin; growth promotion; CD4 receptor; HIV-1; antiviral; FMDV; foot and mouth disease virus; immunoglobulin B; IgB; anti-allergic; plasmodium falciparum; circumsporozoite; antimalarial; CEFP; cholesteryl ester transport protein; anti-arteriosclerotic.

Chimeric - Measles virus. Chimeric - Homo sapiens.

W09966957-A2.

29-DEC-1999.

The invention relates to novel promiscuous T helper cell epitopes (Th), and immunogenic peptides comprising the Th epitopes of the invention along with B cell epitopes. The Th epitopes and peptide immunogenic peptides comprising the peptides and peptide immunogenic peptides. The The peltopes and peptide immunogenic peptides. The The peltopes and peptide immunogenic peptides are used to induce a T helper cell response, and centaring them, are used to induce a T helper cell response, or peptide immunogenic peptide immunogenic may be used for prevention and/or treatment of infections (HIV, foot-and-mouth disease or malaria); for cancer immunotherapy; for inhibition of the action of lutehising hormone cell assign phormone (LIRH) for contraception, treatment of hormone-cell and phormone (LIRH) for contraception, treatment of hormone-cell and performed promone contraception of boar taint in meat, and a promiscuous of immunocastration); for promoting the growth of animals or for immunocastration; for promoting the growth of animals or for immunocastration; for promoting the growth of animals or for immunocastration; for promoting the growth of animals or for immunocastration; for promoting the growth of animals or for immunocastration; for promoting the growth of animals or for immunocastration; for promoting the growth of animals or for immunocastration; for interesting in genetically diverse subjects) into an immunogen cell proper cepticopes. Sequence AAV91121 represents a promiscuous T helper cell redarged immunocastration; and AAV91226 and AAV9126 represents a promiscuous T helper cell redarged into percent in the treatment of anitype. AAV91197 are anitypen. AAV91197 and AAV91126 and AAV9126. AAV91120 and AAV91201-V9120 are anitypenic peptides. AAV91201-V9120 and AAV91201-V9120 and AAV91201-V9120 anitypenic peptides any periode comprising an LHRH sequence joined to a promiscuous The proper anitypenic peptides anitypenic peptides and AAV91201-V9120 and AAV91201-V9120 animunocast anitypenic peptides and AAV91201-V91
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          are HIV-1 neutralising B-cell epitopes, and AAY91248-Y91251 and AAY91258-Y91273 are antigenic peptides comprising MVH Th and HIV-1 B-cell epitope which may be used as a component in an anti-HIV-1 vaccine. AAY91198 and AAY91199 are respectively an immunostimulatory invasin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  protein epitope from Yersinia species, and hinge spacer peptide, both of which may optionally be used in the antigenic peptides of the
                                                                                                                                                                                                                New artificial T helper cell epitope and derived immunogens with target antigenic site, for immunization against e.g. malaria, arteriosclerosis or human immune deficiency virus

The specification describes peptide immunogens comprising a synthetic helper T cell (Th) epitope and a target antigen, luteinising hormone-releasing hormone (LHRH). The peptide immunogens cause induction of a specific immune response to LHRH which is involved in regulation of spermatogenesis, ovulation, oestrus, sexual development and secretion of sex hormones. Provision of a promiscous T helper epitope (which is functional in genetically diverse subjects) provides optimum immunogenicity to the B cell epitopes of the target antigen and thus high antibody titres against the target antigen. The peptide immunogens of the invention are used to vaccinate against mammalian LHRH, for use as (reversible) contraceptive; control of hormone-dependent tumours (cancer of prostate or breast, also endometriosis); to prevent beast taint (and improve meat quality) and for immunocastration. The present sequence appears in the specification.
                                                                                                                                                                                                                                           Helper T cell epitope; peptide immunogen; LHRH;
luteinising hormone-releasing hormone; spermatogenesis; ovulation;
osstrus; sexual development; sex hormone; promiscuous T helper epitope;
vaccine; contraceptive; hormone-dependent tumour; prostate cancer;
breast cancer; endometriosis; boar taint; meat quality; immunocastration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New peptide immunogen containing luteinising hormone-releasing hormone antigen site and helper {\tt T} cell epitope, for e.g. contraception and treatment of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; Page 93; 102pp; English.

C remplex: An immunoglobulin heterotetramer subunit consists of two identical light (hain disulfide bonds. In some cases, such as IqA and IgM, the subunits associate into creation; immunoglobulin homology and Immunoglobulin homology (fragment) rimmunoglobulin homology (imagent) rimmunoglobulin rimmunoglobulin homology (imagent) rimmunoglobulin 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        C; Species: Ginglymostoma cirratum (nurse shark)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Rydullar, I.; Sanchez, F.; Martin Martin, A.; Martinez-Herrera, D.; Ponz, F. Blant Mol. Biol. 30, 191-197, 1996
A:Title: Nuclectide sequence of Chinese rape mosaic virus (cilseed rape mosaic virus), a A; Exterence number: 856053; MuID:96197410
A; Accession: 856053
A; Status: nucleic acid sequence not shown; translation not shown
A; Residues: 1-1597 (AGT)
A; Residues: 1-1597 (AGT)
A; Cross-references: EMBL:U3094
A; Note: readthrough of the terminator UGA occurs between codons CAA for 1103-Gln and CAA
A; Note: the internal stop codon is translated as X
A; Note: the nucleotide sequence was submitted to the EMBL Data Library, July 1995
C; Superfamily: cucumber mosaic virus RNA 1 protein
C; Keywords: nucleotidyltransferase
                                                                                                                                                                                                                                                                                                                                      Chacesion: C8648

A.Title: The human FGF-5 oncogene encodes a novel protein related to fibroblast growth A; Reference number: A31194; MuID:89096942
A. Accession: B31194
A. Accession: B31194
A. Status: preliminary; not compared with conceptual translation
A. Molecule type: mRNA
A. Residues: 1-38 < ZHA>
